

BOMBELLI

For Bombelli, improving environmental sustainability means going beyond compliance with minimum requirements and aiming for a more proactive environmental management approach.

We are further transitioning our equipment range to electrically powered engines as an alternative to diesel. We are implementing programs to reduce, reuse, and recycle waste at all stages of production.

We collaborate with raw material suppliers to reduce packaging or use recyclable packaging. We have implemented a zero-waste policy and also have awareness and training programs for employees on eco-sustainable practices and energy conservation.

We are optimizing our Supply Chain Optimization thanks to:

- Selection of eco-sustainable suppliers and assessment of their environmental impact.
- Reduction of transportation distances by choosing local suppliers whenever possible.
- Partnerships with partners to share resources and optimize shipments.
